devices on your network must also be reconfigured to connect to the new network name.

Hidden SSID

For security purposes, you may choose to hide your network's SSID by selecting enable from the drop-down list. This will prevent computers scanning for the presence of wireless networks to detect your network name. The default setting is disable.

Authentication Type

Select an authentication type from the drop-down list. The default setting is Open System.

Open System: The sender and the receiver do NOT share a secret key. Each party generates its own key-pair and asks the receiver to accept a randomly generated key. Once accepted, this key will only be used for a short period of time. Afterwards, a new key will be generated and agreed upon.

Shared Key: Authentication is based upon a secret key shared by both the sender and the receiver. If Shared Key is selected, you cannot choose the WEP disable option.

WPA Pre-shared key: The WPA Pre-shared Key authentication standard uses a password or "key" between 8 and 32 characters. This encryption key is changed after every dialog box using the Temporary Key Integrity Protocol (TKIP), which allows users to change keys based on dialog box and automatically synchronize keys between devices on the network. The TKIP encryption algorithm is stricter than the one used by WEP but is based on the same standard.

WPA: The 802.1x authentication protocol, allows users to authenticate wireless network access through a RADIUS Server and is a required by WPA standard. If no RADIUS Server exists in your network environment, you still can use WPA through the use of WPA Pre-shared Key.

WEP Key

The GN-BR31NE-RH supports two WEP standards: 64-bit,128-bit. Select either 64-bits or 128-bits from the drop-down list activate WEP encryption. The 64-bits encryption uses 40 bits as a secret key, (user-defined) and the remaining 24 bits are reserved. The 128-bits encryption uses 104 bits as a secret key, (user-defined) and the remaining 24 bits are reserved.

WPA Re-key

Enabling the requirement for WPA rekeying of a Passphrase for increased security. Default is disable.

WEP Re-key Timer

Specify time (in minutes) for expiration of the current WPA Key.
